

RUN-009 - Software Deployment via Intune / Company Portal

Purpose

Guide L2 Desktop Engineering staff through deploying software to Windows endpoints using Microsoft Intune. Covers adding a new application to Intune, assigning it to user/device groups, monitoring deployment, and troubleshooting failed installations. User self-service via Company Portal is also addressed.

Prerequisites / Access Needed

Requirement	Details
Approved software request REQ ticket	Manager authorization required; security review for non-standard software
Intune admin access	Role: Intune Administrator or Device Configuration profile author
Software package	Approved installer: .msi, .exe, .msix, or wrapped Win32 app
IntuneWin packaging tool	Microsoft Win32 Content Prep Tool - stored at \\summit-fileserver\IT-Tools\IntuneWin\
Approved software list	Check SummitDesk CMDB > Software Register before adding new titles

Deployment Types Reference

Deployment Type	Use Case	Intune App Type
Required / Mandatory	All users/devices must have it	Assignment type: Required
Available (self-service)	Users can install on-demand via Company Portal	Assignment type: Available

Uninstall	Remove software from devices	Assignment type: Uninstall
Win32 app	Complex installers (.exe, custom switches)	Win32 App - requires IntuneWin wrapping
Microsoft Store app	UWP / Store apps	Microsoft Store app (new)
Line of Business (LOB)	Internal or vendor .msi/.msix	LOB app

Procedure

1. Validate the Request

1. Open the REQ ticket in SummitDesk.
2. Confirm the software is on the **Approved Software List** (SummitDesk CMDB > Software Register).
3. If the software is **not** on the approved list: - Do not deploy until security review is complete. - Comment on the ticket and submit a Security Review request to SOC: soc@summitit.com, referencing the REQ ticket. - Security review SLA: 3 business days for standard software; 7 days for applications with admin privileges or network access.
4. Confirm the license entitlement: - How many seats are purchased? - Is there a license key or activation mechanism? Document it in the ticket.

2. Obtain and Prepare the Installer

1. Download the approved installer from the vendor or internal software repository at `\\summit-fileserver\IT-Software\Approved\`.
2. Verify the file hash against the vendor-published SHA256 checksum. Run in PowerShell: `powershell Get-FileHash "C:\Temp\setup.msi" -Algorithm SHA256`
3. Test a manual silent install on a test device to confirm the install switches work: - MSI: `msiexec /i setup.msi /qn /norestart` - EXE: varies by vendor; document the silent install flags.

3. Package as IntuneWin (Win32 Apps Only)

For .exe installers that cannot be uploaded directly, wrap them with the Microsoft Win32 Content Prep Tool:

1. Copy the tool from `\\summit-fileserver\IT-Tools\IntuneWin\IntuneWinAppUtil.exe` to your local machine.
2. Open a command prompt: `IntuneWinAppUtil.exe -c "C:\Temp\AppSource" -s setup.exe -o "C:\Temp\Output" - -c: folder containing the installer and dependencies - -s: main setup file - -o: output folder for the .intunewin file`
3. The tool generates `setup.intunewin` in the output folder.

4. Add the App to Intune

1. Log into <https://intune.microsoft.com>.

2. Navigate to **Apps > All Apps > + Add**.
3. Select the appropriate app type:

Installer Type	Intune App Type to Select
<code>.intunewin</code> (wrapped Win32)	Windows app (Win32)
<code>.msi</code> (simple)	Line-of-business app
<code>.msix</code>	Line-of-business app
Microsoft Store app	Microsoft Store app (new)

For Win32 App - upload and configure: - Upload the `.intunewin` file. - Fill in **App information**:

- Name: Descriptive name (e.g., "Adobe Acrobat Reader DC 2025")
- Publisher: Vendor name
- Version: Software version number
- Category: Select appropriate category
- **Program tab:**
- Install command: `msiexec /i setup.msi /qn /norestart` (or `.exe` silent switch)
- Uninstall command: `msiexec /x {Product-GUID} /qn /norestart` (get GUID from vendor docs or registry)
- Install behavior: **System** (installs for all users on the device) or **User** (installs for current user only)
- Device restart behavior: **No specific action** (preferred); set restart if required by installer
- **Requirements tab:**
- OS architecture: **64-bit** (standard for Summit IT)
- Minimum OS: Windows 11 (22H2 or later)
- **Detection rules tab** (how Intune knows if the app is installed):
- Recommended: **Registry rule** (HKEY_LOCAL_MACHINE\SOFTWARE[Vendor][AppName] - Version key)
- Alternative: **MSI product code** (for MSI packages - Intune auto-populates)
- Alternative: **File detection** (check for the main `.exe` in Program Files)
- **Dependencies tab:** Add any prerequisite apps if required (e.g., .NET Runtime).
- **Supersedence tab:** If this replaces an older version, add the older app here.
- Click **Next > Review + Create > Create**.

For LOB (MSI) App: - Upload the `.msi` file. - Intune auto-populates App information from the MSI metadata. - Verify and adjust the Name, Publisher, and Version fields. - Set command-line arguments if needed: `/qn /norestart` - Click **Next > Review + Create > Create**.

5. Assign the App to Groups

1. After creation, go to **Apps > All Apps > [App Name] > Properties > Assignments > Edit**.
2. Click **+ Add group** under the appropriate assignment type:

Assignment Type	When to Use
Required	Mandatory deployment - push to all devices in group without user action
Available for enrolled devices	Self-service - appears in Company Portal for user to install
Uninstall	Remove from devices in the target group

Select the target group: - For company-wide deployment: **All Windows Devices** or **All Summit IT Employees** - For department-specific: e.g., **IT-Department-Devices**, **Finance-Department-Devices** - For individual device: use a dynamic group filtered by device name, or use **Add all devices** and exclude others

Set the **Notifications** setting: - **Show all toast notifications** - recommended for first-time deployments so users are aware - **Only show error toast notifications** - for background/silent deployments

Click **Review + Save**.

6. Monitor the Deployment

1. In Intune > **Apps** > **All Apps** > **[App Name]**.
2. Click the **Device install status** tab.
3. View the table:

Status	Meaning
Installed	Success
Not applicable	Device does not meet requirements (OS, architecture)
Pending	Queued; device not yet checked in
Failed	Install failed - click device for error code
Not installed	Available app - user has not installed yet

4. Allow **up to 8 hours** for all targeted devices to receive and install the app (depends on device check-in schedule - Intune check-in is every 8 hours by default; use Sync to expedite).

Force a Device Sync (Expedite Deployment)

For urgent deployments: 1. In Intune > **Devices** > **All Devices** > search for the target device. 2. Click the device > **Sync** (top menu). 3. The device checks in immediately and downloads new policies and apps.

7. Self-Service via Company Portal (User-Initiated)

For apps assigned as **Available**:

1. The app appears in the user's Company Portal on their Windows device.
2. User opens **Company Portal** (Start Menu > Company Portal or <https://aka.ms/companyportal>).
3. User searches for or browses to the app and clicks **Install**.
4. The installation runs in the background.

When users call about self-service installations: - Confirm they are signed into Company Portal with their Summit IT account (check top-right profile icon in Company Portal). - If the app doesn't appear: confirm the user/device is in the correct Intune group. - If installation fails: collect the error message and open an INC ticket for L2 investigation.

8. Update the Ticket and Notify the Requester

1. Once deployment is successful (target devices show Installed status in Intune), update the REQ ticket.
2. Notify the requester/manager: `` Subject: Software Deployment Complete - [App Name]

Hi [Manager Name],

[App Name] has been deployed to [target group/device list]. Users with the Available assignment can install via Company Portal. Mandatory deployments will install automatically at the next device check-in (up to 8 hours).

If any device shows a failed installation, reply to this ticket with the device name and we will investigate.

Ticket: [REQ-#####] Summit IT Service Desk `` 3. Set ticket status to **Resolved**.

Troubleshooting Failed Deployments

Error Code Reference

Error Code	Meaning	Resolution
0x87D1041C	App not detected after install	Check detection rule - registry key, file path, or MSI GUID may be wrong
0x80070643	Generic install failure	Test manual silent install on device; check installer log in <code>C:\Windows\Temp</code> or <code>%TEMP%</code>
0x87D00607	App superseded	Remove supersedence or update the supersedence relationship in Intune

0xC000000D	Dependency not met	Add missing dependency to Intune; deploy dependency first
0x8007010B	Directory not found	Installer path issue in the .intunewin package - repackage with correct source folder

Checking Intune Client Logs on Device

1. On the target Windows device, open the **Intune Management Extension** logs: - Path:
C:\ProgramData\Microsoft\IntuneManagementExtension\Logs\IntuneManagementExtension.log
2. Open the log in a text editor (or use CMTrace from the SCCM toolkit in \\summit-fileserver\IT-Tools\CMTrace\).
3. Search for the app name or Failed to find the relevant error entries.
4. Copy the error details to the INC ticket.

Verification

Check	Expected Result
Intune > App > Device install status	All target devices show Installed
App present on test device	Manually launch the app and confirm it opens correctly
Company Portal (Available apps)	App appears for targeted users; installs successfully on request
Detection rule fires	Intune confirms installation via configured detection rule

Rollback / If It Fails

Symptom	Action
App deployed to wrong group	Immediately change assignment in Intune to remove from incorrect group
App breaks existing software	Assign Uninstall action to affected devices; escalate to L3 if widespread

MSI leaves residue after uninstall	Use Revo Uninstaller (from Company Portal - IT tools) or custom uninstall script in Intune
Deployment cannot be recalled (already installed)	Deploy Uninstall action or use a remediation script via Intune > Devices > Remediations

Escalation

Condition	Escalate To	Contact
Non-approved software requested	SOC for security review	soc@summitit.com
Intune licensing / tenant issue	L3 - Infrastructure / M365	infra@summitit.com
Complex packaging (dependencies, custom scripts)	L2 Senior Desktop Engineer	Teams: @l2-desktop-leads
Microsoft Intune service issue	Microsoft Support	See vendor-support-contacts.md
